

Dream Petite V.16 T-Select

The Dream Petite V16 loudspeaker cables is a smaller (3/4 size) version of our are our DREAM V14 speaker cables (relative sizes are show below: the Dream V16 with spade lugs is in the middle, and the Dream Petite V16 with banana plugs are left and right). It took over two years to develop the full Dream speaker cables, and then over a year to have the Dream Petite. Many prototypes have been made, and we listened to them extensively, but none of the earlier prototypes made it into beta testing - because none of them sounded sufficiently better than the Hybrid MLT...

As well as the full Dream, this one does.

There are two versions of the Dream Petite V16 loudspeaker cables: the standard V16, and the user-tunable V16-T. The ONLY difference between the two is the tuning collar*** on the V16-T version.

Specifications

- The outer layer of the Dream Petite V16 cable is made of 12 wire assemblies and 4 spacers (dividers);
- Each wire assembly is approximately 6 mm (a bit smaller than 1/4 inch) in diameter, made of 8 individually insulated solid core wires in our proprietary non-resonant distributed LITZ configuration; two different thicknesses (gauges) of 99.99% pure solid core copper, and two different gauges of 99.997% pure solid core silver are used - per each wire assembly.
- Three wire assemblies being run side-by-side create wire bundles (triple runs). Therefore, there are two wire bundles (triple runs) in each Dream Petite cable.
- The two wire bundles (triple runs) are separated by two soft (foam) Teflon dividing runs (spacers).
